

# K89M Mechanical Keyboard **Optional** Firmware

## Upgrade Instructions

**This firmware is an "optional" upgrade. Please read the instructions carefully and install it according to personal needs. After the upgrade, original keyboard settings will be cleared and reset.**

**Firmware version: V1.29**

### **Firmware description and precautions:**

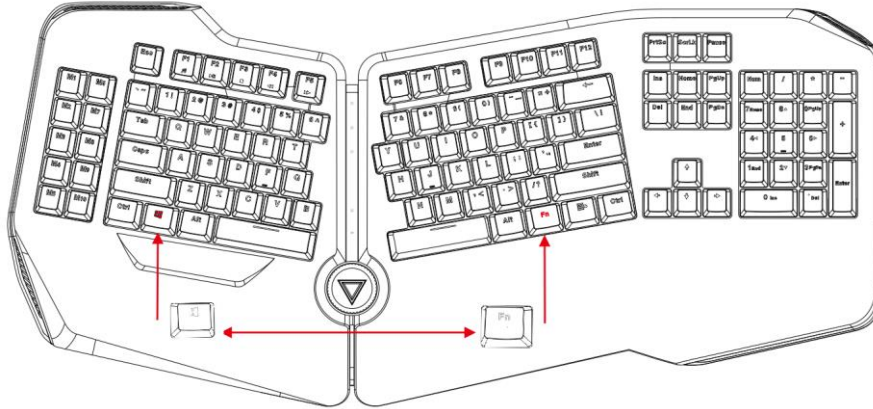

The original factory setting of K89M is Fn on the left and Win key on the right. The purpose is to provide a better user experience and convenience when using the left part of keyboard alone; however, we understand that some users prefer the left placed Win key over right placed one. Our engineering team hence launched a firmware upgrade to swap the location of the Fn and Win keys, so you can make your keyboard handier for you.

Reminder:

1. After the firmware update, the of Fn and Win will still be set in the original location under software configurator. However, the buttons are still fully configurable, and you may change their functions normally.
2. After the firmware is updated, please manually swap keycaps of Fn and Win keys.
3. After upgrade, users may download the original default firmware and roll back to default Win/Fn positioning settings.

## Features After Firmware Upgrade:

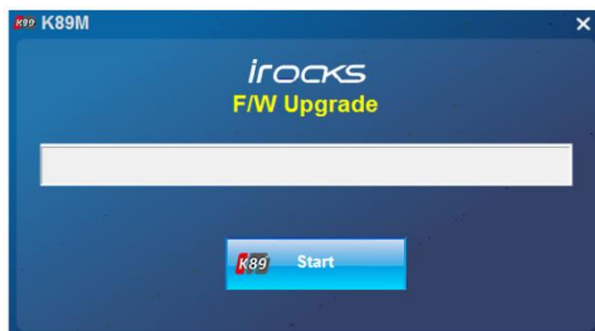

After the update, Win key will be on the left; Fn key will be on the right.

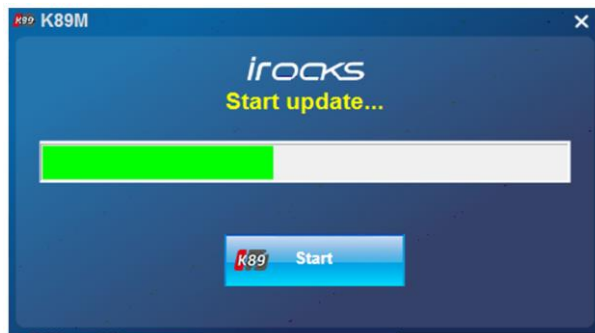

## Upgrade Steps:

1. Connect the keyboard to the PC.
2. Run the downloaded firmware upgrade program and click on Start button to upgrade.

**Note:** Do not unplug the USB cable during the update, shut down or restart your computer.

3. Upgrade completed.
